

True Value Framework (TVF) Research Agenda

Responding to (THE REPORT)

SNJ 03042026 to consider with JWM during April 2026

Link

FIRST CUSTOMER

TVF 2016 (Input data from individual companies and regional sustainable development projects compared to sector commodity BaU for resource flows and towards meeting the SDG indicators and relative to national unit GDP. No supply chain phase balance quantitative analysis beyond market flow and pricing – value chain).

First customer: 2018 Group of Founders and Endorsers of Serious Shea SARL (Burkina Faso) @ EURO 1.4 Million financed by ADB; World Bank; BF Government; SS Founders.

Second Customer: 2023 Mirova Sustainable Investment Fund through Serious Shea Senegal

TVF 2026 (Entire supply chain phase analysis with JWM structural balancing engine which also builds on the data and information requirements of TVF 2016 resource flows, first customers and investor due diligence).

As SNJ JWM have identified the **REPORT DEMONSTRATES THE ANALYTICAL LOGIC. IT WON'T STAND UP AS IT IS. IT NEEDS UPDATING with further research we can input between us (est. 6 weeks) then BUYIN FOR FURTHER (say 3 year) R&D agenda**

First Customer?:

PPPs existing structure? e.g. Bristol One City Plan; Alicante Cherries *to expand*

Partner R&D for research funding:

Public, Non-profit: EU Research Agenda, Universities, Postcode Lottery Founders *to expand*

Private sponsorship: e.g. Institutional Investor, Newmont Corporation, Retail Food/Cosmetics *to expand*

Endorsers: Long Finance.....*to expand*

Communications for B&I and to mainstream

ASSUMPTION TEST

1. The TVF analytical logic compares supply chain structure and relative resource flows agnostic to commodity.

For example in Balancing Act (2005) resource flow aspects are relative to unit GDP and the national average of all sectors.

With respect to resource flows what does the analysis look like if a specific company or supply chain with superior 'best structural and resource flow practices' are compared to the commodity average or 'Business as Usual'(BaU) and then analysed agnostically. See TVF 2018 for Shea Butter BaU vs Serious Shea; Gold Supply Chain vs Newmont Corporation, including the latter employment of Corporate Sustainability-Linked Bonds. This analysis can be propitiatory for individual enterprises.

2. The input data and information to the TVF is of the 'best available accuracy'.

E.g. in Balancing Act (2005) phase 1. Gold Supply Chain (mining) is analysed as having very low land disturbance. Biodiversity credits are suggested by the TVF 2026. Due to the in situ damage by gold mining to biodiversity, it is unlikely the indicator for land disturbance in Balancing Act (2005) is reflecting the Environmental Impact Assessment (EIA - damage to land which is not relative to total national land area) or Strategic Environmental Assessment (SEA - wider regional environmental impact such as pollution to water systems).

The TVF has access to the best information on innovation e.g. calls for proposals for future R&D, Long Finance investment strategy and tools and deployment progress.

3. The costs, efficiency and results of the TVF analytics are superior to a stand alone group of expert organisations.

Eg. The West African Shea supply chain analysis designed and analysed by expert groups to optimise governance structure and logistics with sustainability mandates and latest technologies, supply chain options, through to retail pricing, including with information from the TVF 2018 (BaU baseline), cost in the region of USD 1.4 million. This cost was reduced by 80% for a similar nationwide analysis of Senegal as there were many synergies. This cost reduction for Senegal did not include the extensive carbon accounting due diligence for equity/debt requested by investors.

4. Gold and Shea are representative of wider commodity supply chains.

Eg. Include metals and energy used in lighting, space craft and equipment and debris, air capture of CO₂e; supermarket food and cosmetics sourcing from retail backwards (not mutually exclusive to Shea Butter supply chain), gold value over time, discount rates and the eternal coin (land use and quality?).

To finish 3.4.2026

FUNDAMENTAL QUESTIONS

QUESTION 1. Why should the TVF 2026 'balancing engine' giving the superior supply chain N be trusted as the best out there?

What we can possibly communicate now or soon?

Quantifying Elenor Ostrom's work 'Beyond Panaceas' and comparison to other resource accounting frameworks:

SNJ JWM can write a paper for peer review, following on from SNJ Doctorate and further research; and JWM IoT development work including with IBM R&D linked to an academic institution to explore e.g. UK, US

Bordering on essential and may come from the above:

What we cannot communicate now between us without further maths; mathematical physics; possible materials science R&D incorporated:

The TVF 2026 is grounded in fundamental mathematical proofs which increase and then balance entropy (within and beyond the electromagnetic spectrum to e.g. conceptual knowledge). The current TVF 2026 is based on vector analysis of geometry (triads of tetrahedrons). This needs further work/credibility.

SNJ 'Blue Sky'. Consider Twister Theory where Roger Penrose describes Minkowski (imaginary) space in terms of light rays not points and 4 (2, 2) spinners (the Twister - momentum and angular momentum) to bring in complex numbers. Twister theory provides a mathematical 'space' to explore bridging the gap between quantum physics and general relativity. Such a space maybe compatible with the inner workings of the TVF 'balancing entropy'. I imagine visual similarities to the Tholonic 2D DC balancing bell curve to redefine the dynamic N to create a fractile applied to the Twister Theory 4D image 'spin shape'. Also look at the research agenda of Arniban Bandyopayhay creating a fractile from which he has constructed an artificial brain. Arniban's fractile is derived from triplets within triplet frequencies present from nanoparticles, to the human brain and the human body as a system, to materials from the asteroid ring.

Question 2. How does the TVF build in AI, e.g. machine learning at N, so that it doesn't take on an entity of its own without the full understanding of human societal structures?

Look at Michael Mainelli's work on AI.

Perhaps if Twister Theory could be introduced to AI systems us humans's could analyse where AI has taken on it's own life and is presenting information which does not benefit 'our space'.
