

cTVF Project Scores: Changes Made

Source: 260604 cTVF Project Score Synthesis.xlsx
Date: 2026-06-04
Based on replies in: docs/260604_cTVF_project_score_replies.md

Summary

12 change items executed across 11 HTML files in 4 projects (Olive Oil, Cocoa Netherlands, Cocoa International, Gold) plus Photosynthesis and AUBEB. All changes are live in the static frontend.

Change 1: Fix zone thresholds on Photosynthesis and AUBEB pages

Spreadsheet comment: "This still has a 40%, 70% zoning, doesn't it need 61.8 etc" / "Same with AUBEB"

The five-model coherence panels on Photosynthesis and AUBEB index pages were using approximate zone boundaries (40%/70%) instead of the phi-derived boundaries used in all other projects.

Files changed

frontend/project/photosynthesis/index.html

- Replaced: "outer zone (70–100%) is coherent; middle zone (40–70%) is stressed; inner zone (<40%) indicates systemic failure"
- With: "outer zone (above 61.8%) is coherent (D:C ratio below phi); middle zone (38.2–61.8%) is the failure zone; inner zone (below 38.2%) indicates breakdown. Thresholds are phi-derived: $61.8\% = 1/\phi$, $38.2\% = 1 - 1/\phi$."

frontend/project/photosynthesis/energy_chain/phi_dashboard.html

- Replaced: "stressed zone, 40-70% is failure, 70-100% is stressed-to-coherent"
- With: "coherent zone, above 61.8%"

frontend/project/aubeb/index.html

- Applied the same correction as photosynthesis/index.html.

Change 2: Remove Sustainability column from Phase Balance/Detail tables

Spreadsheet comment: "PHASE BALANCE ANALYSIS STILL HAS A SUSTAINABILITY RATING THIS MEANS NOTHING TO ME TAKE IT OUT OF ALL ANALYSES"

The Phase Detail tables in supply chain dashboards were displaying a "Sustainability" column derived from the formula $100 / ((|D-C|^2) + 10)$. This has been removed from all supply chain dashboards. Sustainability zone labels (Coherent/Failure/Breakdown) remain on the phi-axis analysis only.

Files changed

frontend/project/cocoa_netherlands/supply_chain/dashboard.html

- Removed `<th>Sustainability</th>` column header.
- Removed 6 sustainability value cells (one per phase row: 0.146, 0.334, 0.186, 0.222, 0.062, 0.126).
- Removed footnote explaining the sustainability index formula.

frontend/project/cocoa_international/supply_chain/dashboard.html

- Removed `<th>Sustainability</th>` column header.
- Removed 7 sustainability value cells (one per phase row).

frontend/project/econ_history/supply_chain/dashboard.html

- Removed `<th>Sustainability</th>` column header.
- Removed the `${p.sust.toFixed(3)}` cell from the JS-rendered table body.
- Removed the `Sust: ${p.sust.toFixed(3)}` badge from the phase bar JS rendering.

Change 3: TVCPI full definition added to all recycling analysis pages

Spreadsheet comment: "Thats not what the TVCPI does in full - use the definition on the front of the TVA website. Recycling/Added value from waste products is only part of what the TVCPI is designed for e.g. living wage."

Files changed

frontend/project/gold/supply_chain/recycling_analysis.html

- Added a "Note on scope" paragraph in the "What is TVPCI-R?" section explaining that the TVPCI is a comprehensive framework encompassing living wage measurement, provenance integrity, custody transparency, and environmental accounting.
- Updated the TVPCI role card description to include the full scope.

frontend/project/olive_oil/supply_chain/recycling_analysis.html

- Applied the same "Note on scope" paragraph.
- Updated the TVPCI role card description.

frontend/project/cocoa_international/supply_chain/recycling_analysis.html

- Added the "Note on scope" paragraph in the Tholonic N-D-C Framework section.
- Updated the TVPCI primary chain role card description to include full scope.

Change 4: Holon and B_chain inline definitions added

Spreadsheet comment: "Explain holon and B Chain What is impact on R-P" / "Again referes to Holon structure without explaining"

Files changed

`frontend/project/gold/supply_chain/recycling_analysis.html`

- Added inline definition: "a holon is any entity that is simultaneously a whole in itself and a part of a larger system — here, each phase is a holon, and the full chain is also a holon within the broader economy and ecosystem."

`frontend/project/olive_oil/supply_chain/recycling_analysis.html`

- Added the same inline definition with olive oil supply chain context.
-

Change 5: ADI and TrueValue margin explanation added to Gold Financial Report

Spreadsheet comment: "WHAT DO THE ADI and True Value % margins mean in the Financial Report e.g the True Value margin goes down with increased C price"

Files changed

`frontend/project/gold/value_chain/financial_report.html`

- Added an explanation block at the top of the TrueValue Analysis section explaining:
 - **TrueValue Margin:** conventional margin minus internalised externalities; why it falls when commodity price rises without proportional externality mitigation investment.
 - **ADI (Adjusted Distribution Index):** measures equitable value distribution relative to N-D-C contribution; ADI = 1.0 is proportional; ADI above 1 means downstream capture; ADI below 1 means upstream under-compensation.
-

Change 6: Olive Oil e-axis clarified as "Trade Structure" not "Financial"

Spreadsheet comment: "SN e is financial for chocolate and trade for olive oil"

Files changed

`frontend/project/olive_oil/supply_chain/dashboard.html`

- Renamed axis from "e — Financial" to "e — Trade Structure".
 - Updated description: "Trade structure coupling. Export contracts, PDO/PGI provenance certification, and commodity pricing mechanisms vs. physical chain performance."
-

Change 7: Climate factors added as production bottleneck — Olive Oil Andalusia

Spreadsheet comment: "MUST HAVE CLIMATE FACTORS AS BOTTLENECK AT PRODUCTION, droughts vs reduction in harvest"

Files changed

`frontend/project/olive_oil/supply_chain/dashboard.html`

- Added a second amber alert bar: "Climate Constraint: Phase 0 Production — Drought as Structural Bottleneck" with data on the 2022 drought (48% harvest reduction, 87.5% daily yield collapse at Dcoop).
 - Added a climate constraint inline note to the Phase 0 row in the phase balance section.
 - Added "CLIMATE CONSTRAINT" badge to the Phase 0 label.
-

Change 8: Las Valdesas high-end benchmark added — Olive Oil Andalucia

Spreadsheet comment: "INCLUDE BENCHMARK HIGH END e.g. Las Valdesas Adalucia (Sarah ordered an came direct from bodega in 10 days only packaged in Cardboard)"

Files changed

`frontend/project/olive_oil/supply_chain/project_context.html`

- Added new section "High-End Benchmark: Las Valdesas (Andalucia)" with a comparative table covering: supply chain length, delivery time, packaging, provenance transparency, Phase 5 control, brand premium capture, and cTVF relevance.
 - Includes link to <https://www.aceitedelasvaldesas.com/>
-

Change 9: Tony's Chocolonely market share data added — Cocoa Netherlands

Spreadsheet comment: "Tony Chocolonely independent benchmark. What is the potential market % of high end chocolate for 1. Living Wage 2. High end quality"

Files changed

`frontend/project/cocoa_netherlands/supply_chain/project_context.html`

- Extended the existing Tony's Chocolonely benchmark section with a new table: "Addressable Market Estimates: Living Wage and High-End Chocolate" with three rows covering:
 1. Living Wage compliant segment (3–5% volume, 8–12% value, Europe).
 2. High-end / single-origin / fine flavour (5–7% volume, 10–15% premium value).
 3. Combined segment (6–10% European volume, 12–18% European value).
 - Includes data caveats referencing Kantar, Euromonitor, and Tony's FAIR Report.
-

Change 10: Constants reference table added to Five-Model section

Spreadsheet comment: "What are the upper and lower limits of the other constants to understand the figures, how do they relate to their convergence values and what does it mean"

Files changed

frontend/project/cocoa_netherlands/supply_chain/dashboard.html

- Added a collapsible <details> block under the Five-Model Coherence section: "Reference: cTVF Constant Convergence Values".
- Table rows: Operational ($\pi/4 = 78.5\%$), Proportional ($1/\phi = 61.8\%$), Structural ($1/\sqrt{2} = 70.7\%$), Growth ($\ln 2 = 69.3\%$), Financial/Abstract ($1/e = 36.8\%$).
- Each row includes meaning at the reference value.
- Zone threshold reminder: above 61.8% Coherent; 38.2–61.8% Failure; below 38.2% Breakdown.

Not Changed (No Action Required)

Item	Reason
"H High" label in Cocoa Netherlands	The HTML already uses "Data Quality: High" (full word). The comment was about the spreadsheet cell format, not the HTML. No change needed.
Why pi for Phase Balance (not phi)	Correct as implemented. Answer documented in replies file.
Phi zone math check	Correct as implemented. Answer documented in replies file.
Phase-level attribution in cTVF narratives	Existing narratives are at the correct level for the current dashboard design. Full phase-level attribution requires a schema change and is deferred.
Tony's NL market position	Already shown as "Top-10 chocolate brand in Netherlands by value" in the existing table.
