

CTVF STRATEGIC PARTNERSHIP ANALYSIS — MAY 2026

cTVF and AGORA/EDAAn: Partnership Analysis

How the Clarity True Value Framework and the University of Malaga's Agri-Food Data Space of Andalusia complement each other across four commodity systems: West African Shea, Spanish Olive Oil, Spanish Cherries, and Argentine Soy and Beef under the EU Deforestation Regulation.

Horizon Europe RIA — TrueVal-Chains

HORIZON-CL6-2026-01-CIRCBIO-09

University of Malaga / AGORA Partner

4 Commodity Systems

EDAAn Data Space

N-D-C Framework

01 The Core Complementarity: Infrastructure vs. Intelligence**AGORA / EDAAn — Data Infrastructure Layer**

AGORA builds the sovereign, interoperable sharing platform for agricultural data. IoT sensors, satellite feeds, yield prediction, pest monitoring, and the governance architecture (IDSA, Gaia-X) that lets cooperatives, farmers, and companies share data while retaining ownership and control.

What AGORA cannot yet do: tell you which supply chain phases the data belongs to, what the D/C balance of a phase looks like, where value leaks between custody transitions, or how to generate integrated natural capital and GHG accounts that regulators require.

cTVF — Analytical Intelligence Layer

The cTVF is the analytical intelligence layer that sits on top of AGORA's data infrastructure. Phase-resolved schemas tell AGORA exactly what metrics, units, custodians, and transparency classifications matter at each supply chain stage.

The cTVF provides the "what data matters and what it means" answer. It is directly compatible with SEEA natural capital accounting, IPBES biodiversity valuation, GHG Protocol Scope 3, and the EU Economic Accounts for Agriculture.

N-D-C framing of the partnership itself: The AGORA Data Space is a Negotiation (N) state, the emergent stable product of Definition constraints (D: GDPR, IDSA standards, sovereignty rules, governance frameworks) and Contribution outputs (C: shared datasets, business models, analytics

services). The cTVF provides the schema that populates the D and C measurements at each phase, allowing the N state to be quantified rather than asserted.

The Horizon Europe abstract names this correctly: the University of Malaga / AGORA role is "agrifood supply chain and value chain data model verification, Andalucian data input coordination." AGORA verifies cTVF models with real field data and coordinates the regional data input that makes the models empirically grounded, rather than analytically hypothetical.

Neither cTVF alone nor AGORA alone can deliver a credible CRCF carbon credit, a EUDR due diligence statement, or a SEEA natural capital account for Andalusian olive oil that will satisfy auditors. Together they can: AGORA provides the data governance layer (chain of custody, sovereignty, interoperability); cTVF provides the analytical accounting layer (phase-resolved GHG emission factors, natural capital valuations, equity impact metrics).

02 Commodity-by-Commodity Analysis

- Olive Oil
- Spanish Cherries
- West African Shea
- Argentine Soy / Beef

Spanish Olive Oil

Andalusia — World Production Leader — Strongest Partnership Fit

- Andalusia olive production ~65% of world supply
- Spanish cooperative share ~65% of national production
- AGORA olive demonstrators Pest monitoring, EXPOLIVA 2025
- Key trade asymmetry Spain export bulk → Italy premium rebrand

Andalusia is not just a regional context for olive oil: it is the analytical center of the global olive oil supply chain. AGORA's existing relationships with Andalusian cooperatives and its demonstrators (Olive Leaf Spot monitoring, EXPOLIVA 2025) make it the natural regional data gateway for cTVF phase modeling.

The Spain-to-Italy value transfer asymmetry is the defining structural problem in olive oil economics. Spain exports bulk oil; Italy re-bottles and re-brands it as premium product, capturing a substantial margin that is invisible to Spanish cooperative members. Mapping this phase-by-phase (cultivation, milling, bulk export, Italian blending, retail packaging, consumer) with cTVF's D/C balance metrics makes the value leakage quantitative, not anecdotal.

AGORA's relationships with Cooperativas Agro-alimentarias de Espana (a named TrueVal-Chains consortium partner) are the data access path into cooperative production records. The ROBIN Horizon Europe project (Andalusia

governance, named in the TrueVal-Chains abstract as a complementary partner) adds a policy layer to the data infrastructure.

Olive mill waste (alpeorujo, vegetation water) represents a circular bioeconomy stream. This is a classic cTVF Contribution measurement: the waste outputs of Phase 2 (milling) become the Definition inputs of a parallel bioeconomy phase (energy, compost, cosmetics). AGORA's sensor infrastructure can instrument this flow; cTVF quantifies whether the D/C balance of the waste valorization phase is sustainable or structurally fragile.

AGORA PROVIDES

Sensor data and yield prediction feeds from Andalusian olive groves. Cooperative relationships and data governance trust. Regional administration access (CAPADR, Junta de Andalucía). Olive mill waste stream monitoring. EDAAn federated platform for data sovereignty across cooperative members.

CTVF PROVIDES

Phase schema (cultivation, harvest, milling, storage, bulk export, blending, retail). D/C balance metrics per phase. Value leakage model for Spain-Italy asymmetry. Natural capital accounts (soil carbon, water, biodiversity) in SEEA format. Circular bioeconomy phase for waste valorization.

JOINT PRODUCT

First phase-resolved natural capital and value chain account for Andalusian olive cooperatives, directly usable for CRCF carbon credit applications, CAP policy submissions, and cooperative business model improvement assessments benchmarked against OECD Spain policy recommendations.

03 Structural Collaboration Mechanisms

1 Schema Contribution Flow

cTVF's phase schemas (Phase → Metric → Unit → Source → Custodian) provide AGORA with precise data collection templates for each commodity. AGORA's demonstrators collect data against these schemas. This eliminates the common failure mode where data infrastructure collects everything but cannot answer specific regulatory or market questions because the schema was not designed with the analytical output in mind.

2 Empirical Validation Loop

AGORA's Andalusian field data (real cooperative records, sensor outputs, olive mill throughput, cherry yield trials) validates and stress-tests cTVF's phase models. cTVF's N-D-C balance metrics tell AGORA whether its data captures the right signals or misses critical phase boundary information. The validation loop runs in both directions and improves both systems.

3 Regulatory Compliance as the Joint Product

CRCF carbon credits, EUDR due diligence statements, and SEEA natural capital accounts all require both a data governance layer (chain of custody, sovereignty, interoperability) and an analytical

accounting layer (phase-resolved emission factors, natural capital valuations, equity metrics). AGORA and cTVF each supply one layer. Together they produce what neither can produce alone.

4 Multi-Actor Panel Access

The Horizon Europe call requires genuine co-creation with a Multi-Actor Panel. AGORA's existing relationships with Andalusian cooperatives, farmers, and regional administration (Junta de Andalucia, CAPADR) are the access route to olive and cherry cooperative representatives needed for the panel. AGORA is not just a technical partner: it is the regional legitimacy anchor for the EU commodity components of the TrueVal-Chains project.

5 European Data Space as EUDR Infrastructure

The EUDR requires federated, sovereignty-preserving traceability across jurisdictions. AGORA's Data Space standards (IDSA, Gaia-X) are not a generic data platform: they are precisely the technical architecture EUDR due diligence requires. A joint AGORA/cTVF EUDR compliance module would be commercially viable as a service product for EU food importers and Mercosur commodity exporters seeking regulatory certainty under the trade agreement.

04 Partnership Summary by Commodity

COMMODITY	AGORA PROVIDES	CTVF PROVIDES	JOINT PRODUCT
 Olive Oil	Sensor data, cooperative relationships, Andalusian governance, circular waste stream monitoring	Phase schema, D/C balance, value leakage model (Spain-Italy), natural capital accounts	First phase-resolved natural capital + value chain account for Andalusian olive cooperatives
 Cherries	Yield prediction, water stress monitoring, EUFRIN network (18 countries)	Phase model, rootstock/climate constraint mapping, mechanization efficiency index	Transparent EU horticultural benchmark for cross-governance comparative dataset
 Shea	EU data space governance standards, import verification infrastructure	First phase-resolved Scope 3 GHG emission factors, supply chain transparency classification	CSRD-compatible Scope 3 shea data pipeline accessible to EU manufacturers
 Arg. Soy/Beef	Federated data space architecture for cross-jurisdictional traceability, EUDR compliance infrastructure	Phase-resolved deforestation risk index, EUDR risk category mapping from N-D-C transparency scores	First EUDR-compliant Data Space demonstrator for Mercosur commodities

05 Positioning the Partnership

AGORA has built the data governance infrastructure that tells commodity supply chains *how* to share data trustworthily. The cTVF tells them *what data matters*, *what it means*, and what regulatory and market questions it can answer. Neither is useful without the other at the scale the EU's bioeconomy, EUDR, and CRCF agendas now demand.

The cleanest pitch for a Horizon Europe consortium or an initial meeting with AGORA is this: AGORA's EDAAn Data Space becomes the regional data infrastructure for the Andalusian commodity chains (olive oil, cherries); the cTVF becomes the analytical intelligence layer that converts AGORA's data into the phase-resolved, N-D-C-balanced, regulatory-grade accounts that cooperatives, policymakers, and downstream buyers actually need. The partnership is not a collaboration of convenience: it is a structural division of labour between infrastructure and intelligence.

Within the TrueVal-Chains Horizon Europe RIA, AGORA's formal role covers data model verification and Andalusian data input coordination. In practice, the relationship is broader: AGORA is the regional legitimacy anchor that gives the project its cooperative sector credibility, its field data access, and its path to the Multi-Actor Panel co-creation requirement that the call mandates.
